```
The invention relates to interconverted mutants of chromoproteins (CP) or cluorescent proteins (FP) and nucleic acids encoding them. The mutant is CC derived from a Chidnarian species, preferably a non-bioluminescent CC invention is based on the finding that although green fluorescent protein (GFP) like chromoproteins and fluorescent proteins exhibit some degree of CC (GFP) like chromoproteins and fluorescent proteins exhibit some degree of CC (GFP) like chromoproteins and fluorescent proteins exhibit some degree of CC (GFP) like chromoproteins and fluorescent proteins exhibit some degree of CC (GFP) like chromoproteins and fluorescent proteins exhibit some degree of CC (GFP) like chromoprotein some degree of CC (GFP) like chromoprotein some degree of CC (GFP) like chromoprotein the two types of proteins. Mutagenesis of the CC (GFP) like a fluorescent protein in a chromoprotein activity on the fluorescent protein mutant, with CC (Chromoprotein activity on the fluorescent protein mutant, with CC (Chromoprotein or liverion also relates to expression constructs, CC (Chromoprotein or fluorescent protein mutant; and antibodies specific for interconverted mutant proteins of the invention. The interconverted mutants are useful as colouring agents in, for example, food compositions, pharmaceuticals, cosmetics and living organisms. Proteins with Chromoprotein activity are also useful as labels in biological CC analyte detection assave, as selectable markers in recombinant DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Chromoprotein; fluorescent protein; CP; FP; interconverted mutant; Cnidnarian; Anthozoan; labelling; colouring agents; pigment; analyte detection assay; selectable muscreen; selective filter; fluorescence resonance energy transfer; FRET; biosensor; whole cell marker; second messenger detector; in vivo marker; fluorescence activated cell sorting; fluorescent timer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel nucleic acid encoding in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       17-JUL-2003

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       resonance energy transfer (FRET) applications, as biosensors in prokaryotic and eukaryotic cells, as markers of whole cells to detect changes in multicellular reorganisation and migration, as second messenger detectors, as in vivo markers in animals (e.g., transgenic animals), in fluorescence activated cell sorting applications, in protease cleavage assays, and in assays to determine the phospholipid protease cleavage assays, and in assays to determine the phospholipid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 composition in biological membranes. Proteins with fluorescent protein activity can also be used as fluorescent timers, where the switch of one fluorescent colour to another (e.g., green to red) is concomitent with the ageing of the protein and is useful for determination of the activation or deactivation of gene expression. The present sequence represents a Discosoma sp. red fluorescent protein DsRed mutant generated in an example of the invention. The present sequence is not shown in the specification, but was derived from the wild-type DsRed sequence

                                                                밁
                                                                                                        ঠ
                                                                                                                                                                                                                                                The invention relates to interconverted mutants of chromoproteins (CP) or CP (Iluorescent proteins (FP) and nucleic acids encoding them. The mutant is CP chidarian species, and most preferably an Anthozoan species. The mutant is CP (Cidarian species, and most preferably an Anthozoan species. The control is based on the finding that although green fluorescent protein (CPP) like chromoproteins and fluorescent proteins exhibit some degree of CPP) like chromoproteins and fluorescent proteins exhibit some degree of CPP (1) like chromoproteins and fluorescent proteins exhibit some degree of CPP) that are occupied by noticeably CPP (1) in the two types of proteins exhibit some degree of CPP (1) like chromoprotein in for example, a fluorescent protein, control con
                                                                                                                                                                                                    Query Match
                                                                                                                                                                                                                                                                                       fluorescent colour to another (e.g., green to red) is concomitant with the againg of the protein and is useful for determination of the activation of gene expression. The present sequence represents a Discosoma sp. red fluorescent protein DsRed mutant generated in an example of the invention. The present sequence is not shown in the specification, but was derived from the wild-type DsRed sequence (ADH34489) shown in Fig 1 and the information provided on page 42.
                                                                                                                                                                                                                                              Sequence 225
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Example 1; Page; 56pp; English.

RESULT 58
CC protein (1) comprising a 241 residue amino acid sequence (see ABB5678, CC S1), with one or more point mutations at amino acid sequence (see ABB5678, CC X164, or M183. Also described: (1) a fusion protein comprising (1); (2) CC an isolated nucleic acid encoding (1); (3) a vector comprising the comprision for target compression and comprising the comprision protein, or for target compression, and localisation of fusion proteins, or for target compression, and/or folding that use fluorescent protein can also be compactly for compression, and/or folding kinetics as compared to wild type correspond to potentiased variant. The present sequence represents a mammalian correspond to potentianed variant. The present sequence is not given in the consistent of bicosoma red fluorescent protein variant from the compact to wild type correspond to the compact of the compact of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes an isolated Discosoma red fluorescent protein (I) comprising a 241 residue amino acid sequence (see ABP5667)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New Discosoma red fluorescent protein, useful for functional screens as a reporter for gene transcription, for target characterization and localization of fusion proteins, or for scaffolds for protein and peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                18-MAY-2001; 2001US-0291871P

The invention relates to an isolated colour-facilitating molecule (CFM) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous non-white light or particle emission. CFMs are useful for producing a transgenic animal which exhibits a novel colour e.g. sheep with blue or red coloured fleece. They are useful for producing coloured plant
                                                                                                                                        Novel color-facilitating molecule for producing a biomatrix, has a polypeptide which alone/along with molecules imparts altered visual characteristics to cells in the absence of excitation by extraneous

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cc extracts, e.g. flavouring, beverage or juice or colouring agent. Other cuses include transducing or intensifying an image, providing additional clight for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car cy upholstery. CPMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, corans are useful in the colour in contemplated uses include, cin sunscreens. CPMs modify visible colour in edible and/or ornamental cc fungal species, and in fruits and vegetables to enhance their companies, and in fruits and vegetables to enhance their contemplated uses of distorted light spectra (biomatrix). The first all-protein chromophore to be isolated was Green Fluorescent protein (GFP). The sequences given in records ABP69924-ABP70048 represent CPM related amino critical sequences. Chromo/fluoro proteins are useful in analyte detection assays, as colouring agents, as markers in recombinant DNA applications, as sunscreens or filters, in fluorescence resonance energy transfer (FRET) applications, as biosensors in prokaryotic and eukaryotic cells, in screening assays, as second messenger detectors, in fluorescence activated cell sorting applications, in protease cleavage assays or as fluorescent timers. The present sequence is Discosoma sp. drrP583 (NFP-6) mutant protein of the invention. Note: This sequence is not shown in the specification, but is derived from Discosoma sp. drrP583 (NFP-6) wild-type protein shown as SEQ ID NO:8 (AAEZ8833) in page 70-71 of the specification

Compositions proteins and recorded to as 148, 165, 167 and considered to different residues in the two types of proteins. Mutagenesis of the contered to those found in a chromoprotein is therefore proposed to confer consorprotein activity on the fluorescent protein mutant, with consorprotein activity on the fluorescent protein mutant, with consorprotein so the invention also relates to expression constructs, converted manner. The invention also relates to expression constructs, converted mutant proteins of the invention. The interconverted conference the invention of an interconverted interconverted mutant protein of an interconverted converted mutant protein of the invention. The interconverted composition in any application that employs a chromoprotein or interconverted mutant proteins of the invention. The interconverted compositions pharmaceuticals, cosmetics and living organisms. Proteins composition in the proteins of the protein activity are also useful as labels in biological and compositions in biological as smarkers and selective filters. Chromoprotein considered the protein activity useful in fluorescence considered to proteins and markers in animals (e.g., transgenic colls and organisms), and composition in biological membranes. Proteins with fluorescence activated cells sorting applications, as second composition in biological membranes and migration, as second composition in biological membranes. Proteins with fluorescent protein considered the protein of the protein activation of the considered cells to detect the considered considered as fluorescent timers, where the switch of one considered considered considered consi
The invention relates to interconverted mutants of chromoproteins (CP) of fluorescent proteins (FP) and nucleic acids encoding them. The mutant is derived from a Chidnarian species, preferably a non-bioluminescent Chidarian species, and most preferably an Anthozoan species. The invention is based on the finding that although green fluorescent protein (GFP)-like chromoproteins and fluorescent proteins exhibit some degree
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Misc-difference
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Misc-difference
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Key
Misc-difference
                   in an example of the invention. The present sequence is not shown in specification, but was derived from the wild-type DsRed sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Example 1; Page; 56pp; English.

The present invention describes an isolated Discosoma red fluorescent protein (I) comprising a 241 residue amino acid sequence (see ABP56678, S1), with one or more point mutations at amino acid position N24, F125, K164, or M183. Also described: (1) a fusion protein comprising (I); (2) an isolated nucleic acid encoding (I); (3) a vector comprising the nucleic acid of (2); (4) a host cell comprising the vector; (5) a retroviral cDNA expression library comprising the nucleic acid of (2). o encoding (I); and (6) methods of making a fluorescent variant. The Discosoma red fluorescent proteins are useful for functional screens as reporter for gene transcription (e.g. as a fusion protein), for target characterisation and localisation of fusion proteins, or for scaffolds for protein and peptide libraries. The fluorescent proteins can also be
                                                                                                                                                                                                                                          New Discosoma red fluorescent protein, useful for functional screens as a reporter for gene transcription, for target characterization and localization of fusion proteins, or for scaffolds for protein and peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Discosoma

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  used as selectable markers or reporter molecules for a variety of bioassays, including methods that use fluorescence activated cell sorting (FACS) as a selection mechanism. The method of directed protein evolution is useful for obtaining improved variants of red fluorescent protein. The variants of Discosoma red fluorescent protein have greatly improved brightness, expression, and/or folding kinetics as compared to wild type or a codon optimised variant. The present sequence represents a mammalian codon optimised Discosoma red fluorescent protein variant from the present invention. N.B. The present sequence is not given in the specification, but is derived from the protein in Fig 1 as stated in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Discosoma

Also described: (1) a fusion protein comprising (1); (2) CC an isolated nucleic acid encoding (1); (3) a vector comprising the CC nucleic acid of (2); (4) a host cell comprising the vector; (5) a CC retroviral cDNA expression library comprising the nucleic acid of (2), or CC encoding (1); and (6) methods of making a fluorescent variant. The CC Discosoma red fluorescent proteins are useful for functional screens as a CC reporter for gene transcription (e.g. as a fusion protein), for target CC characterisation and localisation of fusion proteins, or for scaffolds CC for protein and peptide libraries. The fluorescent proteins can also be CC used as selectable markers or reporter molecules for a variety of CC bioassays, including methods that use fluorescence activated cell sorting CC (FACS) as a selection mechanism. The method of directed protein evolution is useful for obtaining improved variants of red fluorescent protein. The CC variants of Discosoma red fluorescent protein have greatly improved cor a codon optimised variant. The present sequence represents a mammalian CC codon optimised variant. The present sequence represents a mammalian CC present invention. N.B. The present sequence is not given in the CC present invention, but is derived from the protein in Fig 1 as stated in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

CC different residues in the two types of proteins Mutagenesis of the CC residues in these key positions in, for example, a fluorescent protein, CC to those found in a chromoprotein is therefore proposed to confer CC chromoproteins being able to be converted into fluorescent proteins in a CC chromoproteins being able to be converted into fluorescent proteins in a CC chromoprotein or fluorescent protein mutant, with the recombinant protein mutant protein constructs, the invention also relates to expression constructs of the invention; the recombinant protein mutant; and antibodies specific for CC chromoprotein or fluorescent protein mutant; and antibodies specific for interconverted mutant protein protein mutant; and antibodies specific for fluorescent protein mutant; and antibodies specific for conjunction are useful as colouring agents in, for example, food compositions, pharmaceuticals, cosmetics and living organisms. Proteins CC compositions (e.g. the production of transgenic cells and organisms), and CC analyte derection assays, as selectable markers in recombinant DNA CC applications (e.g. the production of transgenic cells and organisms), and CC analyte derectors, as in exposition activity useful in fluorescence cells as markers of whole cells to detect changes in multicellular reorganisation and migration, as second CC animals), in fluorescence protein activity useful in fluorescence cells as in vivo markers in animals (e.g., transgenic cells and in biological membranes. Proteins with fluorescent protein cells and migration, as second cells composition in biological membranes. Proteins with fluorescent protein cells and in assays to determinate the phospholipid cells and in biological membranes. Proteins with fluorescent protein cell cells in an example of the protein and is useful for determination of the switch of one cells fluorescent protein Darkd mutant generated cell and in assays to determination of the membranes. Protein bardd mutant generated cell and fluorescent protein bardd mutant generated i
(GFP)-like chromoproteins and fluorescent proteins exhibit some degree homology, there are certain positions (referred to as 148, 165, 167 and 203; numbering corresponds to GFP) that are occupied by noticeably
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to interconverted mutants of chromoproteins (CP) fluorescent proteins (FP) and nucleic acids encoding them. The mutant iderived from a Chidnarian species, preferably a non-bioluminescent Chidarian species, and most preferably an Anthozoan species. The invention is based on the finding that although green fluorecent protein the content of the content protein the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Misc-difference
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 1; Page; 56pp; English.

The invention describes a first mutant fluorescent protein (I) comprising an amino acid sequence that differs from that of a corresponding wild-type red fluorescent protein by an amino acid substitution, where the first mutation fluorescent protein mutant has an optical property that differs relative to the corresponding optical property produced by the wild-type red or green fluorescent protein. (I) is useful for detecting expression of gene. The polynucleotide (II) encoding (I) is useful for detecting expression of a gene which involves introducing (II) into a cell or organism, allowing the cell to replicate, and detecting expression of the nucleic acid by emission of fluorescent light. The expression of the nucleic acid expression is detected in vivo or in
                                                                                                                                                                                                                                                                                                                                                                                                                          New first mutant fluorescent protein having an optical property relatively different to a corresponding optical property produced by wild-type red or green fluorescent protein, useful for detecting expression of a gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                fluorescent protein; red fluorescent protein; green fluorescent protein; gene expression detection; regeneration; multiple labeling system; in vivo marker; microinjection assay; taxonomic marker; colour indicator; food additive; cosmetic; Actinodiscus; Discosoma; mutein; mutant; RedI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               vitro. (II) is useful for regenerating an animal such as a zebrafish which contains (II). (I) is useful as a marker for detecting expression of a gene, in biochemical assays, and as reagents. (I) is also useful in multiple labeling systems, as in vivo markers such as in mRNA microinjection assays, and as taxonomic markers for studies of genetics, colour indicators in diagnostic kits, coloured food additives, and commetics ingredients (I) is useful in research for up or down regulation, to monitor promoter activity, to allow longer term monitoring and to localise proteins. (I) has enhanced properties such as substantially enhanced fluorescence and reduced toxicity. This is the amino acid sequence of RedI, a mutant of the red fluorescent protein isolated from an aquatic species believed to be either an Actinodiscus or nigonome associate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              fluorescent protein; red fluorescent protein; green fluorescent protein; gene expression detection; regeneration; multiple labeling system; in vivo marker; microinjection assay; taxonomic marker; colour indicator; food additive; cosmetic; Actinodiscus; Discosoma; mutein; mutant; RedII;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Corallimorpharia red fluorescent protein mutant RedII.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC differs relative to the corresponding optical property produced by the CC wild-type red or green fluorescent protein. (I) is useful for detecting expression of gene. The polynucleotide (II) encoding (I) is useful for detecting expression of a gene which involves introducing (II) into a CC cell or organism, allowing the cell to replicate, and detecting CC expression of the nucleic acid by emission of fluorescent light. The CC expression of the nucleic acid expression of fluorescent light. The CC expression of the nucleic acid expression is detected in vivo or in CC which contains (II). (I) is useful as a marker for detecting expression of a gene, in blochemical assays, and as reagents. (I) is also useful in CC multiple labeling systems, as in vivo markers such as in mRNA CC microinjection assays, and as taxonomic markers for studies of genetics, CC colour indicators in diagnostic kits, coloured food additives, and CC commetics ingredients. (I) is useful in research for up or down CC regulation, to monitor promoter activity, to allow longer term monitoring CC and to localise proteins. (I) has enabled properties such as CC amino acid sequence of RedII, a mutant of the red fluorescent protein CC isolated from an aquatic species believed to be either an Actinodiscus or CC consections.

                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                       밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to mutant red and green fluorescent proteins which have higher fluorescent intensities compared to the wild-type proteins CC from which they are derived. The invention also discloses nucleic acids crowding the mutant fluorescent proteins, and transgenic animals CC enogding the mutant fluorescent proteins, and transgenic animals CC comprising such a nucleic acid. The mutant red fluorescent proteins (RFP) CC from a novel wild-type RFP (referred to as Ac/DBRFP) isolated from a green fluorescent proteins (GFP), are derived CC mushroom coral believed to be either an Actinodiscus or Discosoma CC species, while the mutant green fluorescent proteins (GFP), Green I CC (ADZ84227) and Green (ADZ84229), are derived from a novel wild-type GFP (known as MCGFP) isolated from the great star coral Montastraea CC cavernosa. The Ac/DBRFP and MCGFP mutants were obtained by subjecting the CC wild-type Ac/DBRFP and MCGFP cDNAs to low-stringency PCR to introduce CC random mutations, cloning the PCR products into bacterial expression the coral mutant fluorescent proteins of the invention may be used in a wide range CC fluorescence compared to those expressing the wild-type proteins. The CC fluorescent proteins of the invention may be used in a wide range CC applications. They are useful as markers for detecting the expression of a gene of interest, or can be used as in vivo markers in mRNA CC microinjection assays in transgenic animals. They can be used in multiple captures of the second additionally be used as taxonomic markers for studies of CC conidarian genetics, as color indicators in diagnostic kits, as colored CC food additionally be used as taxonomic markers for studies of CC conidarian genetics, as cosmetic ingredients. The present protein Red CC conidarian for the mutant Actinodiscus/Naccooma red fluorescent protein Red
                                                                                                                                                                                                                                                                                                                                                                Matches 221;

ADZ84225
The invention relates to mutant red and green fluorescent proteins which CC have higher fluorescent intensities compared to the wild-type proteins CC encoding the mutant fluorescent proteins, and transgenic animals CC comprising such a nucleic acid. The mutant red fluorescent proteins (RFP) CC of the invention, Red I (ADZ84223) and Red II (ADZ84225), are derived CC from a novel wild-type RFP (referred to as AC/DSRP) isolated from a CC mushroom coral believed to be either an Actinodiscus or Discosoma CC (ADZ84227) and Green (ADZ84223) are derived from a believed to be either an Actinodiscus or Discosoma CC (ADZ84227) and Green (ADZ84229), are derived from a invent wild-type GFP (known as McGFP) isolated from the great star coral Montastrace CC wild-type Ac/DsRPP and McGFP cDNAs to low-stringency PCR to introduce CC wild-type Ac/DsRPP and McGFP cDNAs to low-stringency PCR to introduce CC wild-type Ac/DsRPP and McGFP cDNAs to low-stringency PCR to introduce CC mutant fluorescent proteins of the PCR products into bacterial expression CC fluorescence compared to those expressing the wild-type proteins. The CC fluorescence compared to those expressing the wild-type proteins. The CC fluorescence compared to those expressing the wild-type proteins. The cCC of applications. They are useful as markers for detecting the expression of a gene of interest, or can be used as in vivo markers in mRNA CC misconjection assays in transgenic animals. They can be used in Edward assays and as reagents. CC crepresents or can be used as in vivo markers for studies of condarian genetics, as color indicators in diagnostic kits, as colored CC represents and as cosmetic ingredients. The present sequence CC represents enhanced condariants are found to have a fluorescent intensity at least 50% greater than the mutant RFP Red I (ADZ84223).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel mutant fluorescent protein comprising amino acid sequence that differs from wild-type red or green fluorescent protein by amino aci substitutions, useful as markers for detecting desired gene expressi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Corallimorpharia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  07-OCT-2004
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ADQ59562
The invention describes a composition (I) comprising complementary fragments of a protein or mutant protein, where the fragments generate optically detectable signal when associated, and each of the mutant protein fragments is fused to a separate molecule. Also described are:
                                                                                                                                                                                                 Composition useful in protein fragment complementation assays for drug discovery and high-throughput screening, comprising complementary fragments of protein or mutant protein, generating optically detectable
                                                                                                                                                                                                                                                                                                      WPI;

(I) is useful in PCAs and other assays for drug discovery, target validation, high-throughput screening, high-content screening, pathway mapping, drug mechanism-of-action studies, biosensors and disgnostics.

(I) is useful for engineering different colour PCAs for a variety of applications in biology and biotechnology. This is the amino acid fluorescent proteins with Asquores green flourescent protein, variants of which can be created with Asquores green flourescent protein, variants of relative to wild type GFP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              interactions, involving reassembling separate fragments from an optically detectable protein, and detecting the reassembly by units of reconstitution of activity of the optically detectable protein, where the reassembly of the fragments is operated by the interaction of molecular domains fused to each fragment, and is independent of other molecular processes; detecting biomolecular interaction, involving selecting an appropriate optically detectable protein, effecting fragmentation of the optically detectable protein such that the fragmentation results in reversible loss of protein function, fusing or attaching fragments of the

The present invention describes an isolated Discosoma red fluorescent CC protein (I) comprising a 241 residue amino acid sequence (see ABP56678, CC S1), with one or more point mutations at amino acid sequence (see ABP56678, CC K164, or M183. Also described: (1) a fusion protein comprising (1); (2) CC an isolated nucleic acid encoding (I); (3) a vector comprising the cc mucleic acid of (2); (4) a host cell comprising the vector; (5) a CC retroviral cDNA expression library comprising the nucleic acid of (2), or CC encoding (I); and (6) methods of making a fluorescent variant. The CC Discosoma red fluorescent proteins are useful for functional screens as a CC reporter for gene transcription (e.g. as a fusion protein), for target CC for protein and localisation of fusion proteins, or for scaffolds (for protein and localisation of fusion proteins, or for scaffolds (2) to see a selectable markers or reporter molecules for a variety of CC used as selectable markers or reporter molecules for a variety of CC used as selection mechanism. The method of directed protein evolution (2) wariants of Discosoma red fluorescent protein have greatly improved CC variants of Discosoma red fluorescent protein have greatly improved CC brightness, expression, and/or folding kinetics as compared to wild type or a codon optimised Discosoma red fluorescent protein represents a mammalian CC codon optimised Discosoma red fluorescent protein have greatly improved cor a codon optimised Discosoma red fluorescent protein have greatly improved cor a codon optimised Discosoma red fluorescent protein have greatly improved cor a codon optimised Discosoma red fluorescent protein have greatly improved cor a codon optimised Discosoma red fluorescent protein have greatly improved cor a codon optimised Discosoma red fluorescent protein have greatly improved cor a codon optimised Discosoma red fluorescent protein have greatly improved corescent invention. N.B. The present sequence is not given in the greatly discosoma red fluorescent protein will the cor

CC (GFP)-like chromopyroteins and fluorescent proteins whibit some degree of CC (GFP)-like chromopyroteins to GFP) that are occupied by noticeably CC different residues in the two types of proteins. Mutagenesis of the CC residues in these key positions (referred to as 148, 165, 167 and CC of those found in a chromopyrotein is therefore proposed to confer CC tromopyrotein activity on the fluorescent protein mutant, with CC chromopyrotein activity on the fluorescent protein mutant, with CC elimber of the invention also relates to expression constructs, CC vectors, host cells and host cell progeny comprising a nucleic acid of the invention, the recombinant production of an interconverted cC chromopyrotein or fluorescent protein mutant; and antibodies specific for CC chromopyrotein or fluorescent protein mutant; and antibodies specific for CC chromopyrotein or fluorescent protein mutant; and antibodies specific for CC chromopyrotein or fluorescent protein mutant; and antibodies specific for CC chromopyrotein protein fluorescent protein mutants; and antibodies specific for CC chromopyrotein protein activity as a colouring agents in, for example, food compositions, pharmaceuticals, cosmetics and living organisms. Proteins CC with chromopyrotein activity are also useful as sunscreens and selective filters. Chromopyrotein CC analyte detection assays, as selectable markers in recombinant DNA are also useful as sunscreens and selective filters. Chromopyrotein CC mutants having fluorescent protein activity useful in fluorescence cells and organisms), and are also useful as sunscreens and selective filters. Chromopyrotein CC changes in mutalicellular recorganisation and migration, as second cells and inventions, as in vivo markers in animals (e.g., transgenic cells animals), in fluorescence activated cell sorting applications, in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to interconverted mutants of chromoproteins fluorescent proteins (FP) and nucleic acids encoding them. The mutaderived from a Chidnarian species, preferably an on-bioluminescent Chidarian species, and most preferably an Anthozoan species. The invention is based on the finding that although green fluorecent provention is based on the finding that although green fluorecent provention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel nucleic acid encoding interconverted mutant of chromo-or fluorescent protein which are useful as biosensors, coloring agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Bulina ME, Chudakov D,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             26-DEC-2001; 2001US-0343128P

Proteins with fluorescent protein activity can also be used as fluorescent timers, where the switch of one fluorescent colour to another (e.g., green to red) is concomitant with the againg of the protein and is useful for determination of the activation or deactivation of gene expression. The present sequence represents a non-fluorescent Discosoma sp. red fluorescent protein DsRed mutant, DsRed-NF, which has chromoprotein activity and which was generated in an example of the invention. The present sequence is not shown in the specification, but was derived from the wild-type DsRed sequence (ADH34489) shown in Fig 1 and the information provided on page Discosoma red fluorescent 25-MAR-2003 ABP56679; Sequence Synthetic Discosoma Discosoma; red ABPS6679 WPI; 2003-120798/11. 20-MAY-2002; 2002WO-US015968 28-NOV-2002 WO200294992-A2 Mammalian codon optimised Discosoma 18-MAY-2001; 2001US-0291871P (RIGE-) RIGEL PHARM INC 181 181 121 121 61 61 щ Н Similarity MRSSKNYIKEFMRFKVRMEGTVNGHBFBIEGBGBGRPYEGHNTVKLKVTKGGPLPFAWDI 225 LSPQFQYGSKYYVKHPADIPDYKKLSFPEGFKWERVMNFEDGGVVTVTQDSSLQDGCFIY 120 standard; YMAKKPVQLPGYYYVDSKLDITSHNEDYTIVEQYERTEGRHHLFL 225 KVKFIGVNFPSDGPVMQKKTMGWEASTERLYPRDGVLKGEIHKALKLKDGGHYLVEFKSI 180 LSPQFQYGSKVYVKHPADIPDYKKLSFPEGFKWERVMNFEDGGVVTVTQDSSLQDGCFIY MRSSKNVIKEFMRFKVRMEGTVNGHEFEIEGEGEGRPYEGHNTVKLKVTKGGPLPFAWDI YMAKKPVOLPGYYYVDAKLDITSHNEDYTIVEQYERTEGRHHLFL KVKFIGVNFPSDGPVMQKKTMGWEACTERLYPRDGVLKGENHMALKLKDGGHYLVEFKSI Conservative Ş (first entry) fluorescent protein; protein; 98.3%; 98.2%; protein variant F125L 1; Score 1193; DF Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC The present invention describes an isolated Discosoma red fluorescent CC protein (I) comprising a 241 residue amino acid sequence (see ABP56678, CC S1), with one or more point mutations at amino acid position N24, F125, CC K164, or M183. Also described: (1) a fusion protein comprising (I); (2) CC an isolated nucleic acid encoding (I); (3) a vector comprising the CC curviviral cDNA expression library comprising the vector; (5) a CC encoding (I); and (6) methods of making a fluorescent variant. The CC encoding (I); and (6) methods of making a fluorescent variant. The CC Discosoma red fluorescent proteins are useful for functional screens as a CC reporter for gene transcription (e.g. as a fusion protein), for target CC characterisation and localisation of fusion proteins, or for scaffolds CC for protein and peptide libraries. The fluorescent protein scan also be CC used as selectable markers or reporter molecules for a variety of CC bioassays, including methods that use fluorescence activated cell sorting CC (FACS) as a selection mechanism. The method of directed protein evolution CC is useful for obtaining improved variants of red fluorescent protein. The CC variants of Discosoma red fluorescent protein have greatly improved cor a codon optimised variant. The present sequence represents a mammalian CC codon optimised variant. The present sequence is not given in the CC present invention. N.B. The present sequence is not given in the sequence is not given in the color of the color of the color of the present sequence is not given in the color of the co

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes an isolated Discosoma red fluorescent CC protein (I) comprising a 241 residue amino acid sequence (see ABP56678, CC S14, with one or more point mutations at amino acid position N24, F125, CC K164, or M183. Also described: (1) a fusion protein comprising the CC mucleic acid of (2); (4) a host cell comprising the vector; (5) a CC retroviral cDNA expression library comprising the vector; (5) a CC encoding (I); and (6) methods of making a fluorescent variant. The CC Discosoma red fluorescent proteins are useful for functional screens as a CC reporter for gene transcription (e.g. as a fusion protein), for target CC characterisation and localisation of fusion proteins, or for scaffolds (for protein and peptide libraries. The fluorescent proteins can also be CC used as selectable markers or reporter molecules for a variety of CC bioassays, including methods that use fluorescence activated cell sorting (PACS) as a selection mechanism. The method of directed protein evolution is useful for obtaining improved variants of red fluorescent protein. The CC variants of Discosoma red fluorescent protein have greatly improved CC is useful for blacosoma red fluorescent protein as compared to wild type or a codon optimised variant. The present sequence represents a mammalian CC codon optimised variant. The present sequence is not given in the CC specification, but is derived from the protein in Fig 1 as stated in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Best Loc

                                                                                                                                                                                                                                                                     The invention relates to nucleic acid molecules encoding non-aggregating chromo/fluorescent proteins and their mutants. Chromo/fluoro proteins are useful in analyte detection assays, as colouring agents, as markers in recombinant DNA applications, as sunscreens or filters, in fluorescence resonance energy transfer (FRET) applications, as biosensors in prokaryotic and eukaryotic cells, in screening assays, as second messenger detectors, in fluorescence activated cell sorting applications, in protease cleavage assays or as fluorescent timers. The present sequence is Discosoma sp. drrP583 (NFP-6) mutant protein of the invention. Note: This sequence is not shown in the specification, but is derived from Discosoma sp. drrP583 (NFP-6) wild-type protein shown as SEQ ID NO:8 (AAEZ8833) in page 70-71 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acid encoding a non-aggregating chromo- or fluorescent mutant of an aggregating Chidarian chromo- or fluorescent protein or mutant for analyte detection assays or fluorescence activated cell sorting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   21-FEB-2001; 2001US-0270983P.

New fluorescent timer proteins comprising an emission spectrum that changes over time from a first wavelength to a second wavelength, unfor monitoring intracellular protein movement, translocation, traff trafficking

Claim 5; Fig 3; 89pp; English.

CC The invention relates to a fluorescent timer protein having an emission CC spectrum that changes over time after synthesis from a first wavelength CC to a second wavelength. The fluorescent timer proteins are useful in CC monitoring the activity of a promoter, determining the age of a protein, CC enriching an agent that modulates the activity of a promoter and in CC enriching a population of cells comprising a fluorescent timer protein. CC The fluorescent timer proteins are also useful for assessing gene CC expression during development of a multicallular organism or during CC cellular differentiation, in response to a drug or other inducer of CC promoter activity, as a reporter to serve as a read-out of promoter CC activity, monitoring intracellular protein movement or translocation, CC protein trafficking, or protein stability, to investigate temporal CC aspects of the activity of a regulatory element, for determining cell crimiting development and organ remodelling, in spatial and temporal CC visualisation of newly synthesised proteins and accumulated proteins, and CC visualisation and extracellular matrix components. The fluorescent cumer proteins may further be used to investigations where photobleaching CC techniques are employed, as detectable labels, as selectable markers, as CC biosensors in prokaryotic and eukaryotic cells, in protease cleavage as assays, and as second messenger detectors. The nucleic acids can be used CC modifications in cell lines. The present sequence is Discosoma sp. ESNA

The present invention describes an isolated Discosoma red fluorescent protein (1) comprising a 241 residue amino acid sequence (see ABP56678, S1), with one or more point mutations at amino acid position N24, F125, K164, or M183. Also described: (1) a fusion protein comprising (1); (2) an isolated nucleic acid encoding (1); (3) a vector comprising the nucleic acid of (2); (4) a host cell comprising the vector; (5) a retroviral cDNA expression library comprising the nucleic acid of (2), where the comprising the vector comprising the vector.
                                                                                                                                                                                                                                                                                                                              New Discosoma red fluorescent protein, useful for functional screens as reporter for gene transcription, for target characterization and localization of fusion proteins, or for scaffolds for protein and peptid

The fluorescent proteins can also be used as selectable markers or reporter molecules for a variety of bioassays, including methods that use fluorescence activated cell sorting (FACS) as a selection mechanism. The method of directed protein evolution is useful for obtaining improved variants of red fluorescent protein. The variants of Discosoma red fluorescent protein have greatly improved brightness, expression, and/or folding kinetics as compared to wild type or a codon optimised variant. The present sequence represents a mammalian codon optimised Discosoma red fluorescent protein variant from the present invention. N.B. The present sequence is not given in the specification, but is derived from the protein in Fig 1 as stated in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to nucleic acid molecules encoding non-aggregating chromo/fluorescent proteins and their mutants. Chromo/fluoroscent proteins are useful in analyte detection assays, as colouring agents, as markers in recombinant DNA applications, as sunscreens or filters, in fluorescence resonance energy transfer (FRET) applications, as biosensors in prokaryotic and eukaryotic cells, in screening assays, as second messenger detectors, in fluorescence activated cell sorting applications, in protease cleavage assays or as fluorescent timers. The present sequence is Discosoma sp. drrP583 (NFP-6) mutant protein of the invention. Note: This sequence is not shown in the specification, but is derived from Discosoma sp. drrP583 (NFP-6) wild-type protein shown as SEQ ID NO:8 (AAEZ8833) in page 70-71 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New nucleic acid encoding a non-aggregating chromo- or fluorescent mutant of an aggregating Chidarian chromo- or fluorescent protein or mutant for analyte detection assays or fluorescence activated cell sorting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Disclosure; Page; 80pp; English

The carrier useful for immobilizing polypeptides via the carboxyl group of the C terminus. The present sequence represents a Red fluorescent protein variant (DsRed) sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New carrier, useful for immobilizing polypeptides via the carboxyl g of the C-terminus, comprises a protein immobilized adsorptively, and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   amino groups of the polymer compound on the substrate. The invention further relates to a method for the preparation of the protein array. Preferably, the planar substrate has water absorptivity, the polymer used is a polyallyl amine or a polylysine, and the immobilised proteins contain a linker peptide. The protein array of the invention enables the effective and highly sensitive detection of various target substances. Sequences ADT77525-ADT77526 represent proteins whose C-termini were joined to a negatively charged acidic linker peptide (ADT77529) to produce the sequences shown in ADT77527-ADT77528. Sequences ADT77527-ADT77528 were subsequently immobilised on a planar substrate via the

The carrier is useful for immobilizing polypeptides via the carboxyl group of the Cterminus. The present sequence represents an immobilised red fluorescent

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a substrate for a protein array, obtained by combining a polymer compound having primary amino groups in repeating units on a surface of a planar substrate. The invention also relates to a protein array formed by bonding the C-termini of proteins to the primary amino groups of the polymer compound on the substrate. The invention further relates to a method for the preparation of the protein array. Preferably, the planar substrate has water absorptivity, the polymer used is a polyallyl amine or a polylysine, and the immobilised proteins contain a linker peptide. The protein array of the invention enables the effective and highly sensitive detection of various target substances. Sequences ADT77527-ADT7528 represent proteins comprising a C-terminal negatively charged acidic linker peptide (ADT77529) which were immobilised on a planar substrate via the linker peptide to form a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Substrate for protein array, obtained by combining a polymer compound having primary amino groups in repeating units on surface of planar substrate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Example 1; SEQ ID
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI; 2004-766496/75

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes an isolated Discosoma red fluorescent CC protein (I) comprising a 241 residue amino acid sequence (see ABP56678, CC S1), with one or more point mutations at amino acid position N24, F125, CC K164, or M183. Also described; (I) a fusion protein comprising (I); (2) CC an isolated mucleic acid encoding (I); (3) a vector comprising the CC nucleic acid of (2); (4) a host cell comprising the vector; (5) a CC retroviral cDNA expression library comprising the vector; (5) a CC reporter for gene transcription (e.g. as a fluorescent variant. The CC Discosoma red fluorescent proteins are useful for functional screens as a CC reporter for gene transcription (e.g. as a fusion proteins, or for scaffolds cfor protein and peptide libraries. The fluorescent proteins can also be used as selectable markers or reporter molecules for a variety of CC bioassays, including methods that use fluorescence activated cell sorting is useful for obtaining improved variants of directed protein. The variants of Discosoma red fluorescent protein activated recolution is useful for obtaining improved variants of red fluorescent protein. The crimates, expression, and/or folding kinetics as compared to wild type or a codon optimised variant. The present sequence represents a mammalian codon optimised variant. The present sequence represents a mammalian codon optimised Discosoma red fluorescent protein variant from the present invention, but is derived from the protein in Fig 1 as stated in Fig
                                                                                                                                                                                                                       S
                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                        S

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention provides protein and coding sequences of novel fluorescent proteins. These are useful in pharmaceutical compositions and as fluorescent markers for gene expression and protein localization in cellular, developmental or molecular biology, particularly for measuring time-dependent cellular process such as protein diffusion and transport, also for optical information storage. The present sequence is a Discosoma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New

                                                                                                               5
                                                                                                                                                           밁
                                                                                                                                                                                               Ś
                                                                                                                                                                                                                                           문
                                                                                                                                                                                                                                                                                                                                                                                                           The invention describes a polynucleotide sequence (I) encoding a CC Discosoma red fluorescent protein (DBRed) variant having a reduced CC propensity to oligomerise, comprising amino acid substitutions at the AB CC and/or AC interfaces of the wild-type DBRed sequence (SI) comprising 225 cm and/or acids, given in the specification, where the substitutions result in reduced propensity of the DBRed variant to form tetramers. (I) is CC useful for detecting transcriptional activity by providing a host cells conattning a vector which comprises (I) operatively linked to an CC expression control sequence, and an unit to assay the variant fluorescent protein fluorescence, and assaying fluorescence of the variant fluorescent concoding a fusion produced by (VII), where variant fluorescent protein fluorescence is indicative of transcriptional activity. A polynucleotide concoding a fusion protein is useful for the analysis of in vivo CC localisation or trafficking of a polypeptide of interest. A polypeptide marker is useful as markers to identify the location and amount of a complement to or alternative for the green fluorescent protein or its spectral variant, for detecting induction of transcriptions, in CC assay to the variant for detecting induction of transcriptions, in CC applications involving fluorescence energy resonance transfer (PRET), CC applications involving fluorescence energy resonance transfer (PRET), CC applicators for ions and molecules such as Ca2+, Zn2+, for identifying the presence of a molecule in a sample, for identifying a specific contains an enzyme or for determining the pH of the sample. (I) is useful for identifying a region or condition that regulates the activity of a sequence of the protein variant fast T1.

                                                                                                                                                                                                                                                                                                                                                  The invention relates to a polynucleotide sequence encoding a Discosoma red fluorescent protein (DsRed) variant having a reduced propensity to oligomerize. The protein variant comprises one or more amino acid substitutions at the AB and/or AC interface (s) of the wild-type DsRed sequence, where the substitutions result in reduced propensity of the DsRed variant to form tetramers and where the variant displays detectable fluorescence of at least one red wavelength. The composition and methods are useful in producing red fluorescent proteins having reduced propensity for oligomerization, especially tetramerization. The protein may be used in molecular biology and in other scientific applications, such as in immunoassays or hybridization assays, or in tracking the movement of proteins in cells. This sequence corresponds to the DsRed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New monomeric and dimeric Anthozoan fluorescent protein variants with reduced propensity to oligomerize, and encoding polynucleotides, useful molecular biology, e.g. in immunoassays or in tracking protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    red fluorescent protein; DsRed; fluorescence; red wavelength; oligomerization; tetramerization; immunoassay; hybridization assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Disclosure; SEQ ID NO 4; 166pp; English.

                                                                                                                                                                                                                                                                                                                         The invention relates to a polynucleotide sequence encoding a Discosoma red fluorescent protein (DsRed) variant having a reduced propensity to oligomerize. The protein variant comprises one or more amino acid substitutions at the AB and/or AC interface(s) of the wild-type DsRed sequence, where the substitutions result in reduced propensity of the BSRed variant to form tetramers and where the variant displays detectable fluorescence of at least one red wavelength. The composition and methods are useful in producing red fluorescent proteins having reduced propensity for oligomerization, especially tetramerization. The protein may be used in molecular biology and in other scientific applications, such as in immunoassays or hybridization assays, or in tracking the movement of proteins in cells. This sequence corresponds to the DsRed variant T1 protein with a I125R mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New monomeric and dimeric Anthozoan fluorescent protein variants with reduced propensity to oligomerize, and encoding polynucleotides, useful molecular biology, e.g. in immunoassays or in tracking protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Discosoma red fluorescent protein (DsRed)

```
CC at least 80% identity to the GPP superfolding mutant appearing as CC ADMI3535 that has at least one amino acid substitution selected from CC e.g., a substitution at position 30 that is an arginine or a conservative CC variant of arginine and measurable fluorescence activity. Also included CC are directed-evolution for generating an enhanced folding variant of a CC target polypeptide (comprising mutating a polymucleotide encoding CC linking mutated polymucleotides, CI inking mutated polymucleotides to polypeptide encoding folding cC interference domain to form fusion protein (FP) constructs, expressing CC interference domain to form fusion protein (FP) constructs, expressing CC interference domain to form fusion protein (FP) constructs, expressing CC interference domain to form fusion protein generated by the method, an comparison of a fluorescent protein generated by the method, an comparison for a fluorescent protein generated by the method, an command of a fluorescent protein generated by the method, an comparison protein, mutating the first domain of the polypeptide to a poorly folding of command the poorly folding of protein comprising multiple domains comprotein in comparison protein, mutating the second domain, thus identifying a first domain with enhanced folding, joining a second domain, thus identifying a comprision to a fusion protein to form a second fusion protein, mutating the second domain, and detecting an increase in the comparison to a fusion protein to form a second fusion protein in comparison to a fusion protein to form a second fusion protein in comparison to a fusion protein mutated fusion protein in comparison to a fusion protein and detecting an increase in the comparison to a fusion protein, and detecting an increase in the comparison to a fusion protein, and detecting an increase in the comparison to a fusion protein, and detecting an increase in the comparison protein in soluted mucleic acid encoding the GPP, an expression vector comprising the mucleic acid called comparison to a f
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a green fluorescent protein (GFP) that comprises at least 80% identity to the GFP superfolding mutant appearing as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 18; SEQ ID NO 41; 46pp; English

                                                                                                                                   Novel polynucleotide sequence encoding Discosoma red fluorescent protein variant having a reduced propensity to oligomerize, useful for detecting transcriptional activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               enhanced folding variant of target polypeptide and for improving folding and solubility of a target protein. The present sequence represents a coral DsRed enhanced folding variant. NOTE: The authors refer to SEQ ID 38-42 as SEQ ID 1-5 throughout the specification and never refer to SEQ ID 1-37 by number, it is obvious that SEQ ID 38-42 are meant to be SEQ II
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            26-FEB-2001; 2001US-00794308.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             0
```

The invention Discosoma red

describes a polynucleotide (fluorescent protein (DsRed)

sequence (I) encoding a
variant having a reduced

```

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   १
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           문
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       문
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC protein fluorescence, and assaying fluorescence of the variant CC fluorescent protein produced by (VII), where variant fluorescent protein protein a fluorescence of the variant fluorescent protein CC fluorescent protein is indicative of transcriptional activity. A polymucleotide ce encoding a fusion protein is useful for the analysis of in vivo CC localisation or trafficking of a polypeptide of interest. A polypeptide carrier is useful as markers to identify the location and amount of a CC target protein produced, where the target protein is fused to the marker, CC as a complement to or alternative for the green fluorescent protein or CC its spectral variant, for detecting induction of transcriptions, in CC which detects events as the function of the movement of fluorescent general contains and molecules such as Ca2+, Zn2+, for identifying the CC presence of a molecule in a sample, for identifying a specific CC presence of a molecule in a sample, for identifying a specific CC useful for identifying a region or condition that regulates the activity CC of an expression control sequence. This is the amino acid sequence of CC Discosoma red fluorescent protein variant dimer2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches 207; Conservative

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a polynucleotide sequence encoding a Discosoma red fluorescent protein (DsRed) variant having a reduced propensity to oligomerize. The protein variant comprises one or more amino acid substitutions at the AB and/or AC interface(s) of the wild-type DsRed sequence, where the substitutions result in reduced propensity of the BRED polynomerical to form tetramers and where the variant displays detectable pasted variant to form tetramers and where the variant displays detectable fluorescence of at least one red wavelength. The composition and methods are useful in producing red fluorescent proteins having reduced propensity for oligomerization, especially tetramerization. The protein may be used in molecular biology and in other scientific applications, such as in immunoassays or hybridization assays, or in tracking the movement of proteins in cells. This sequence corresponds to the DsRed variant dimer2 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New monomeric and dimeric Anthozoan fluorescent protein variants with reduced propensity to oligomerize, and encoding polynucleotides, useful in molecular biology, e.g. in immunoassays or in tracking protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Coding region fragments from drFPS83 and dmFPS92 were digested with CC restriction endonucleases and combined together to produce a hybrid CC construct. drFPS83 is a full-length cDNA encoding a novel fluorescent CC protein (nFP) from Discosoma sp. "red", a non-bioluminescent species of the Class Anthozoa. The hybrid sequence was changed to optimise the CC codons for expression of the protein in mammalian cells. Fluorescent CC proteins can be used in fluorescent labeling, a useful tool for marking a CC protein, cell or organism of interest. Unlike other markers used in CC protein, do not require an exogenous cofactor or substrate. Methods CC involving fluorescent proteins are also less laborious and less difficult CC control than the traditional methods of fluorescent labeling, where a CC fluorophore derivative. Novel fluorescent proteins isolated from species of the Class Anthozoa can be used as markers for gene expression and CC protein localization studies, and in fluorescence resonance energy CC transfer (FRET) reactions. They may have improved properties and better cuitability for larger excitations compared to prior art fluorescent CC suitability for larger excitations compared to prior art fluorescent contents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match
